In 2L+ EGFR-mutated NSCLC, Aurenix® reduced progression-free survival risk by 38%? (HR 0.62; 95% CI, 0.49 to 0.78; p<0.001).

Median follow-up was 14.2 months across 410 randomized patients in the AURORA-301 study.

Important Safety Information: Aurenix® is contraindicated in patients with severe hepatic impairment; monitor hepatic transaminases prior to initiation.

Study Design (AURORA-301): Randomized, double-blind, placebo-controlled Phase 3 study in 2L+ EGFR-mutated NSCLC.

Primary Endpoint: Progression-free survival (PFS) assessed by blinded independent central review (BICR).

Epidemiology & Disease Burden: NSCLC accounts for approximately 85% of all lung cancers in adults.

Hepatic Safety Monitoring: Evaluate ALT, AST, and total bilirubin prior to starting Aurenix® and periodically thereafter.
